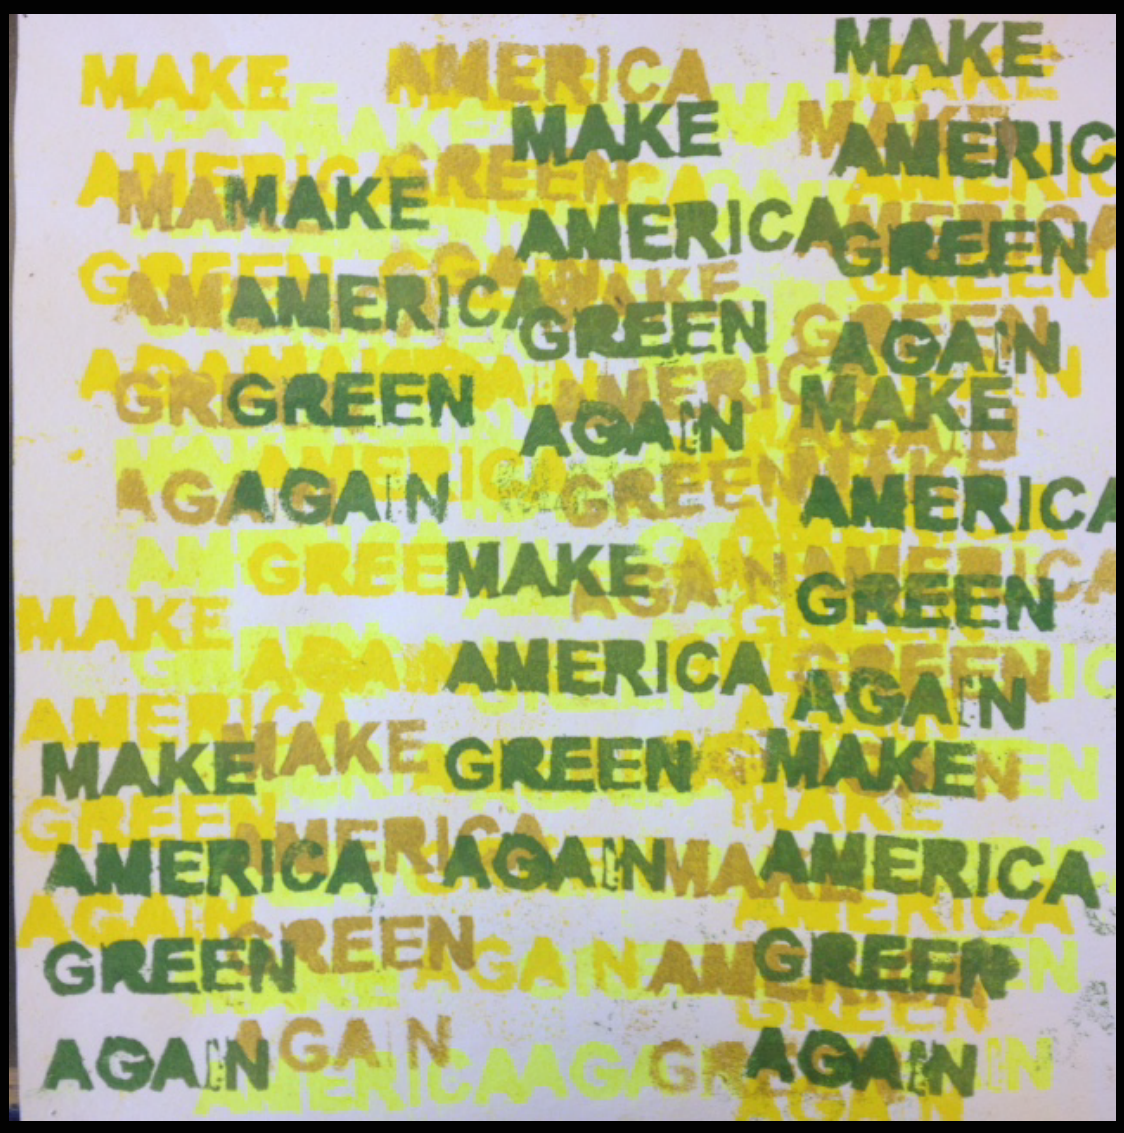
MAKE AMERICA GREEN AGAIN!



Artist: Luke Leupold (SHB Class of 2023)

"America was once a flourishing habitat with clean air and lush forests. Today the problem of pollution is affecting the wilderness of America. With the new president in office, he should really consider this issue, and Make America Green Again!" -- Luke Leupold, SHB Class of 2023

ECO TIP:

The Many Benefits of Native Plants

Native plants are those that grew here in abundance prior to the late 18th century. They have evolved to thrive with the local climate, soil types, and animals. Compared to ornamental exotic species, native plants have many advantages.

Save Water: Once established, many native plants need minimal irrigation beyond normal rain**fall.**
Low Maintenance: Native plants need less fertilizer, little or no pesticides, and need less pruning.
Pesticide Freedom: Native plants have developed their own defenses against many pests and diseases. Natural pest control keeps toxins out of our creeks and watersheds.
Wildlife Habitat: Native plants, birds, butterflies, beneficial insects and other native critters are "made for each other." Native wildlife prefers native plants.
Support Your Local Ecology: Natural landscapes in California display authentic California flora. Our gardens can too!
